

For each pair of equations, use chips to find the numbers that work.
 Numbers in matching shapes must be the same.

$$2 \times \text{hexagon} + 1 = \text{circle}$$

$$\text{circle} - \text{hexagon} = 3$$

$$3 \times \text{hexagon} + 5 = 2 \times \text{circle}$$

$$\text{hexagon} + \text{hexagon} = \text{circle} - 1$$

$$\frac{1}{2} \times \text{hexagon} = \text{circle}$$

$$\text{hexagon} + 4 = 3 \times \text{circle} + 1$$

$$2 \times \text{2} + 1 = \text{5}$$
$$\text{5} - \text{2} = 3$$

$$3 \times \text{3} + 5 = 2 \times \text{7}$$
$$\text{3} + \text{3} = \text{7} - 1$$

$$\frac{1}{2} \times \text{6} = \text{3}$$
$$\text{6} + 4 = 3 \times \text{3} + 1$$
